Procedural text writer	Tell me about a moment when you wrote a procedural writing text? (recipe/instructive/tutorial)
	What was it about?
	Why did you write it?
	Did you struggle with anything while writing it?
	Did the reader struggle to follow it?
	How do you think you could have improved?
	What do you think would help you to do this better? Write a better procedural text?
Feedback as writer	Would you have liked to receive feedback? How?
	What type of feedback?
Example Comparison	Cognitive load theory and Social Comparison Theory emphasize the importance of learning by observing what other people do, say, or write. Based on this some researchers have suggested providing “close examples” of texts to guide the writer. Do you think this could support you? Why?
	what would be elements to make it supportive?
General elements	We are designing a tool that looks like this (show in person). Here you write your text (folded in half). Here is the pen, this is an open canvas. Imagine there are some desirable characteristics good texts should have, how would you signal them?
	Imagine there are some characteristics that good texts should not have, would you like to have that signaled?
	Now imagine you are shown a better text to compare yours with (opens page), what could help you compare both texts?
Requirements	Now imagine we implement all your requirements, what would make you recommend this to your best friend?
	What are the things that would stop you from using it?

Reflective prompts	There is a lot of work on the effectiveness of reflection prompts (questions that help you reflect). Have you ever had to answer reflection questions (in a course, journal, or tool)? Describe your experience
	What questions would help you reflect on the example text?
	What questions would help you self-explain the example text?
	What questions would help you compare both texts?
End	Anything else?
